

Send form data with UTMs to a webhook (e.g. Zapier)

You can send form data with all the UTMs to a webhook in GTM.

Create a trigger

This is a trigger for your tag. It can be as simple as button click or form submitted.

×

Choose trigger type

Create a variables that will capture your form object

Based on the trigger selected, this will change. Basically, you want to capture the form object using `gtm.element`. If your trigger is a form submit button, then your variable may look like this

× formObject 📁

Variable Configuration

Variable Type

 Data Layer Variable

Data Layer Variable Name ⓘ
gtm.element.parentElement.parentElement.parentElement.parentElement

Data Layer Version
Version 2

Here, we are navigating to the parents until we get the all form objects. The number of `parentElement` may vary based on your implementation.

```
//Data Layer Variable Name  
gtm.element.parentElement.parentElement.parentElement.parentElement
```

Create a tag

Finally create CustomHTML tag to send the collected data to your webhook (e.g. Zapier)

```
<script>  
setTimeout(function(){  
  
    var form_obj = jQuery({{formObject}})  
    var emailFilled = $('#default_email', form_obj).val() != ''  
  
    if (emailFilled){  
        var data = handl.j.param(HandL.getAll())  
        var form_data = form_obj.serialize()  
        var xmlhttp = new XMLHttpRequest();  
        xmlhttp.open( "GET",  
'https://hooks.zapier.com/hooks/catch/1234567/abcdefg/?'+data+"&"+form_data, false );  
        // false for synchronous request  
        xmlhttp.send( null );  
        console.log(form_data)  
    }else{  

```

```
        console.log("Not triggered")
    }

}, 100);

</script>
```
